Benford's Law Implementation

Submitted by :

NAITIK MALAV - CS19BTECH11026

JAI GOYAL - CS19BTECH11027

Objective and Theory:

The objective of the assignment is to implement the Benford's First digit Law and First two digits law implementation from the given dataset.

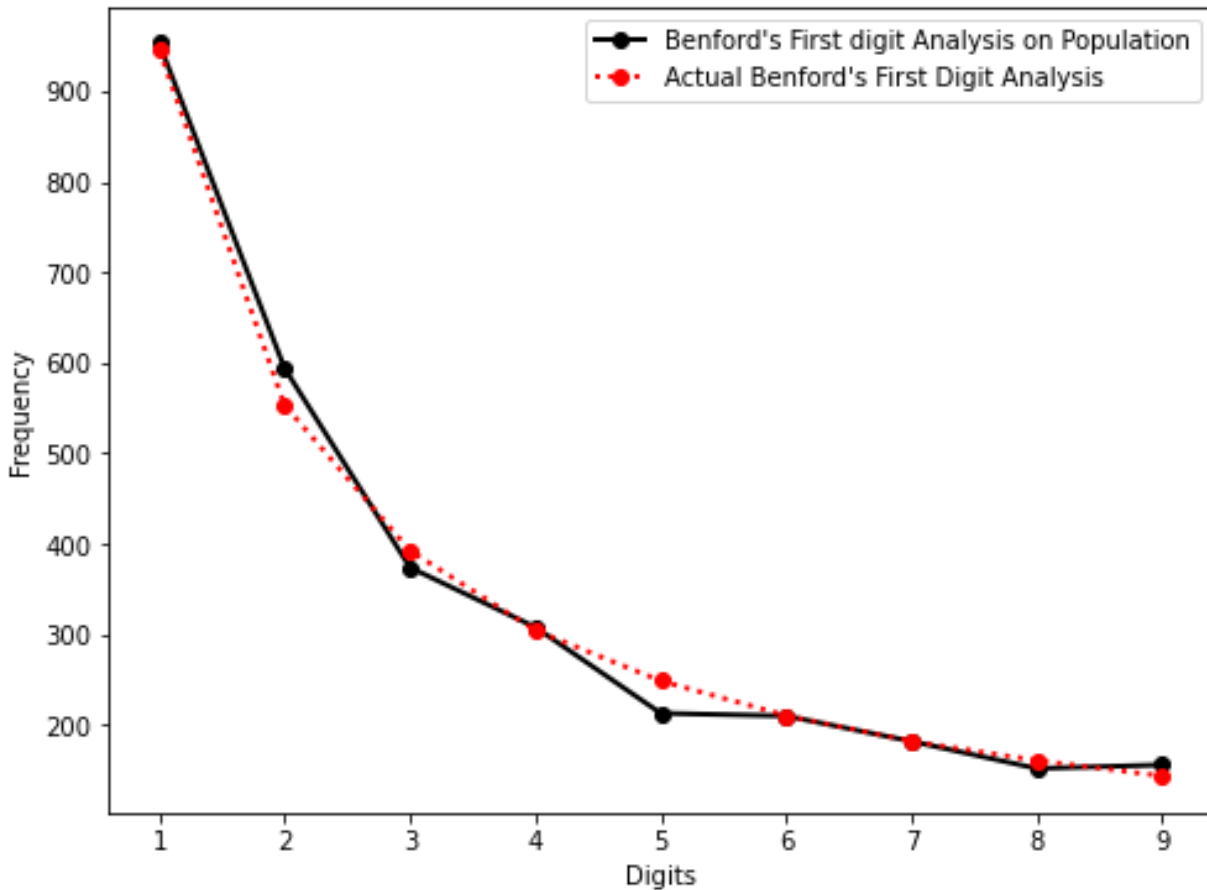

1. `get_first_digit` and `get_FirstTwo_digit` functions are used to extract the digits from a Population column.
2. `count_freq` function calculate the frequency of [0, 9] in and [10, 99] respectively.
3. `benford_frequency` function returns the log distribution.

Results :

Benford's first digit analysis on Population column:

chi square test p value= 10.6314009212393

MAD= 194.14814814814815

Benford's first two digits analysis on Population column:

chi square test p value= 83.41617609082292

MAD= 19.744197530864188
